

HOWLER

A new species of fire point

A revolution in evolution

To the casual observer, this red beast may look like any other fire extinguisher trolley, but to the educated this is indeed an amazing moment in the history of science. The world's first genetically modified fire point has arrived. It is in fact a new species in its own right – ladies and gentlemen, meet the FirePost™. The difference is in the detail.

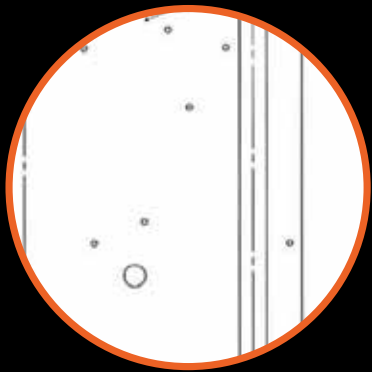

At Howler UK we assembled a team of experts in this obscure field of knowledge, and following months of observation, analysis, design and experimenting, a new creature emerged. So what's the difference?

Modular Concept: The FirePost™ is a modular design, enabling you to 'grow' the fire point to the size of your choice. This offers you the ultimate in flexibility, and it's as easy as 1, 2, 3.

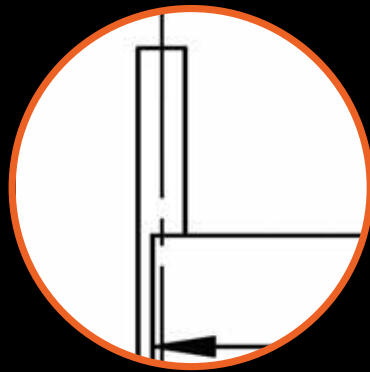

Stability: The centre of gravity on the FirePost™ has been carefully positioned to maximise the stability of the unit. This increases the mobility of the unit and ensures that it doesn't fall over even when there are no extinguishers on it to serve as a counterbalance.

Ready-to-roll: The backboards come with laser cut fixings holes in position for fitting accessories such as Howler alarms and document holders. This speeds up the installation process dramatically and delivers real term cost savings.

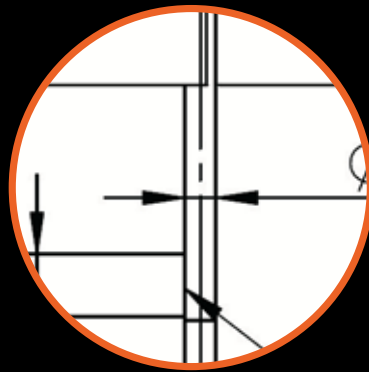

Put it to the test...

Laser cut fixings holes for speedy fitting of accessories

Comfy grips for easy handling

Optional backboard for increased space and additional height

200mm all terrain wheels

Optional basket for up to 4 fire extinguishers of any type
